

Step 1: Create the Repository

1. Log in to your GitHub account.
2. In the upper-right corner of any page, click the + icon and select New repository.
3. Repository name: Enter your enrollment number (e.g., 12345678).
4. Public/Private: Choose your preferred visibility.
5. Initialize this repository: Check the box that says Add a README file.
6. Scroll down and click Create repository.

Step 2: Create the Folders and Files

GitHub doesn't allow you to create an empty folder. You must create a file inside a folder to make the folder exist.

For Assignment_1:

1. On your main repository page, click the Add file button and select Create new file.
2. In the Name your file... box, type exactly this: Assignment_1/[README.md](#)
 - Typing the forward slash (/) automatically turns "Assignment_1" into a folder.
3. In the file content area, you can just type: # Assignment 1 Files.
4. Scroll down, add a commit message (e.g., "Create Assignment_1 folder"), and click Commit changes.

For Assignment_2:

1. Go back to the main page of your repository.
2. Click Add file > Create new file.
3. Type: Assignment_2/[README.md](#)
4. Add some text like # Assignment 2 Files in the editor.
5. Scroll down and click Commit changes.

Step 3: Verify the Result

Your repository main page should now show:

- A README.md file (the main one).
- A folder named Assignment_1.
- A folder named Assignment_2.
